Abstract

Private universities in India are increasingly evaluated on teaching quality, research productivity, student experience, and regulatory compliance. Faculty development is often cited as a key driver of these outcomes, yet empirical evidence that quantifies its impact on organisational performance in the Indian private university context remains limited. This paper empirically examines the relationship between strategic faculty development practices and organisational performance in private universities in Maharashtra. A descriptive and explanatory research design was adopted. Primary data were collected from 240 full-time faculty members across six private universities using a structured questionnaire measured on a five-point Likert scale. The instrument captured five dimensions of faculty development (induction, pedagogical training, research support, performance feedback, and leadership opportunities) and four dimensions of organisational performance (teaching effectiveness, research output, student satisfaction, and accreditation readiness). Scale reliability and construct validity were established using Cronbach's alpha and exploratory factor analysis. Hypotheses were tested using independent samples t-test, one-way ANOVA, Pearson correlation, and multiple regression analysis at 0.05 significance level. The findings reveal a strong and statistically significant positive relationship between strategic faculty development and organisational performance ($r = 0.69$, $p < 0.001$).

The regression model explains 47.2 per cent of the variance in organisational performance, with research support and performance feedback emerging as the most influential predictors, followed by pedagogical training. Universities with high faculty development intensity report significantly higher performance scores than those with low intensity. The study concludes that systematic and integrated faculty development is a critical organisational lever for enhancing institutional performance in private universities and recommends that academic leaders mainstream faculty development into strategic planning, budgeting, and performance management systems.

Keywords: accreditation readiness, faculty development, organisational performance, private universities, regression analysis

I. Introduction

The rapid expansion of private universities in India has intensified competition in the higher education sector. Institutions are judged not only on physical infrastructure but also on demonstrable academic outcomes such as teaching effectiveness, research output, student satisfaction, and compliance with quality assurance frameworks. In this environment, faculty members are central to institutional success because they directly influence curriculum delivery, research activity, mentoring, and stakeholder engagement. Despite this, faculty development in many private universities remains fragmented, event-based, and disconnected from broader organisational goals.

Policies such as the National Education Policy 2020, outcome-based education frameworks, and accreditation mandates from quality assurance bodies have elevated expectations regarding faculty qualifications, continuous professional development, and research contributions. International studies suggest that sustained professional development improves instructional quality, assessment practices, and scholarly productivity. However, the empirical evidence from Indian private universities, especially in Maharashtra, is limited and often descriptive rather than analytical.

The present study addresses this gap by empirically assessing how strategic faculty development influences organisational performance in private universities. The central idea is that when faculty development is planned, structured, and aligned with institutional strategy, it can function as a key organisational capability. The specific objectives of the study are: (i) to measure the current status of faculty development practices in selected private universities in Maharashtra, (ii) to construct an index of organisational performance based on faculty perceptions of teaching, research, student satisfaction, and accreditation readiness, and (iii) to examine the impact of faculty development practices on organisational performance using appropriate statistical techniques. The study thus contributes to organisational research in higher education by moving beyond conceptual discussion and providing quantitative evidence from the Indian private university context.

II. Literature review and hypotheses development

Faculty development has been broadly defined as a set of planned activities aimed at enhancing the knowledge, skills, attitudes, and professional identity of academic staff in their roles as teachers, researchers, and institutional citizens. International literature emphasises that effective faculty development is ongoing, needs-based, contextually relevant, and integrated with institutional priorities rather than being sporadic or compulsory for

compliance alone. Research has linked structured professional development to improved course design, active learning strategies, alignment of assessment with outcomes, and increased scholarly productivity.

From an organisational perspective, investment in faculty development can be viewed as a strategic human resource practice that builds intellectual capital and strengthens organisational learning. Studies grounded in strategic human resource management suggest that development-oriented HR practices contribute to higher organisational performance by enhancing employee commitment, capability, and adaptability. In higher education institutions, this translates into improved student learning, higher research output, better accreditation outcomes, and enhanced institutional reputation.

In the Indian context, regulatory documents such as the University Grants Commission's quality mandate and accreditation manuals underscore the need for continuous faculty development in pedagogy, research, and governance. Nonetheless, empirical studies that explicitly model the relationship between faculty development and organisational performance in private universities are scarce.

Based on the above discussion, the following hypotheses are formulated:

H_1: Strategic faculty development is positively and significantly related to organisational performance in private universities.

H_2: Faculty members in universities with high faculty development intensity report significantly higher organisational performance than those in universities with low intensity.

H_3: Research support and performance feedback significantly predict organisational performance after controlling for demographic variables such as experience and designation.

III. Research methodology

A. Research Design

The study employs a descriptive and explanatory research design. The descriptive component profiles existing faculty development practices and perceived organisational performance. The explanatory component investigates the causal relationship between faculty development and organisational performance using correlational and regression techniques.

B. Population and Sample Design

The population consists of full-time faculty members employed in private universities in Maharashtra. Six private universities were selected using purposive sampling based on criteria such as disciplinary diversity, years of

establishment, and willingness to participate. Within each university, faculty lists were obtained from the Dean of Academics or equivalent office. Stratified random sampling was used to ensure representation from different faculties and designations.

A total of 300 questionnaires were distributed proportionately across the six universities. Out of these, 252 responses were received. After excluding incomplete or inconsistent responses, 240 valid questionnaires were retained for analysis, yielding an effective response rate of 80 per cent. Given commonly accepted rules of thumb for regression analysis, this sample size is adequate for the number of predictors included in the model.

C. Data Collection Instrument

A structured questionnaire was developed based on literature review and discussions with academic administrators. The instrument comprised three sections. Section I captured demographic variables such as gender, age, highest qualification, discipline, designation, years of teaching experience, and university. Section II measured faculty development practices through 25 statements organised into five dimensions: induction, pedagogical training, research support, performance feedback, and leadership opportunities (five items each). Section III measured organisational performance through 16 statements across four dimensions: teaching effectiveness, research output, student satisfaction, and accreditation readiness (four items each).

All items in Sections II and III were measured on a five-point Likert scale ranging from 1 ("Strongly Disagree") to 5 ("Strongly Agree"). Higher scores indicated more favourable perceptions of faculty development and organisational performance. The draft instrument was subjected to expert review by three senior academics to ensure content validity and was pilot tested with 20 faculty members from a non-sampled university. Minor wording refinements were made based on feedback to enhance clarity.

D. Reliability and Validity

Reliability of the scales was assessed using Cronbach's alpha. The overall Faculty Development Scale recorded an alpha of 0.91, while the Organisational Performance Scale recorded an alpha of 0.88, indicating high internal consistency. Dimension-wise alpha values ranged from 0.78 to 0.86, which meet accepted thresholds.

Exploratory factor analysis was conducted using principal component analysis with varimax rotation to examine construct validity. The Kaiser-Meyer-Olkin (KMO) measure of sampling adequacy was 0.89, and Bartlett's test of sphericity was significant at 0.001, confirming suitability for factor analysis. Items loaded strongly on their

intended factors with loadings above 0.60 and minimal cross-loadings, supporting the factorial structure of the scales.

E. Data Analysis Techniques

Data were analysed using standard statistical procedures. Descriptive statistics (means, standard deviations, and frequencies) were used to summarise respondent profiles and key variables. Pearson correlation coefficient was computed to examine the relationship between the Faculty Development Index and the Organisational Performance Index. To test differences between groups, independent samples t-test was used to compare organisational performance across high and low faculty development groups, and one-way ANOVA was used to examine differences across universities. Multiple regression analysis was employed to assess the predictive power of specific faculty development dimensions on organisational performance while controlling for years of experience and designation. The significance level for all inferential tests was fixed at 0.05.

IV. Analysis and results

A. Profile of Respondents

Among the 240 respondents, 58.3 per cent were male and 41.7 per cent female. Approximately 46 per cent were drawn from management and commerce, 34 per cent from engineering and technology, and 20 per cent from other disciplines. Regarding designation, 17.9 per cent were professors, 31.7 per cent associate professors, and 50.4 per cent assistant professors. The average teaching experience was 9.4 years, with a range from 2 to 28 years.

B. Descriptive Statistics

Composite indices were created by averaging item scores for faculty development and organisational performance. Table 1 presents the descriptive statistics.

Table 1: Descriptive Statistics of Key Indices

Variable	Mean	Standard Deviation
Faculty Development Index	3.72	0.61
Organisational Performance Index	3.58	0.64

The Faculty Development Index mean of 3.72 suggests moderate to high agreement that structured development practices exist. The Organisational Performance Index mean of 3.58 indicates generally positive but improvable performance perceptions.

C. Correlation Analysis

Pearson correlation analysis yielded a correlation coefficient of 0.69 between the Faculty Development Index and the Organisational Performance Index ($p < 0.001$), indicating a strong positive relationship. All faculty development dimensions were significantly correlated with organisational performance, with research support ($r = 0.63$, $p < 0.001$) and performance feedback ($r = 0.61$, $p < 0.001$) showing the highest coefficients.

These findings provide initial support for H_1.

D. Group Comparison Based on Development Intensity

To test H_2, respondents were divided into two groups using the median Faculty Development Index score. Faculty with index scores equal to or above the median formed the high development group ($n = 122$), while those below constituted the low development group ($n = 118$). An independent samples t-test revealed that the mean Organisational Performance Index for the high development group ($M = 3.89$, $SD = 0.52$) was significantly higher than that of the low development group ($M = 3.27$, $SD = 0.61$). The t-value of 7.84 ($p < 0.001$) confirmed a statistically significant difference.

Thus, universities where faculty perceive stronger development practices are also perceived as performing better, supporting H_2.

E. Regression Analysis

Multiple regression analysis was conducted with the Organisational Performance Index as the dependent variable. The five faculty development dimensions were entered as independent variables, and years of experience and designation were included as control variables. The results are summarised in Table 2.

Table 2: Multiple Regression Results

Predictor	Standardised Beta (β)	p-value
Induction	0.07	0.162
Pedagogical Training	0.18	0.004
Research Support	0.29	0.000
Performance Feedback	0.24	0.000
Leadership Opportunities	0.09	0.118
Years of Experience	0.04	0.284
Designation	0.05	0.241

The overall model was statistically significant ($F = 40.26$, $p < 0.001$) and accounted for 47.2 per cent of the variance in organisational performance ($R^2 = 0.472$). Research support and performance feedback emerged as the strongest predictors, followed by pedagogical training. Induction and leadership opportunities showed positive but non-significant coefficients when other variables were controlled. The control variables were not significant. These results support H_3, indicating that research support and performance feedback are critical components of faculty development that drive organisational performance.

Conclusion

This empirical study examined the impact of strategic faculty development on organisational performance in private universities in Maharashtra. The results demonstrate a strong positive relationship between faculty development and organisational performance, with nearly half of the variance in performance explained by development-related variables. The findings highlight that research support and performance feedback are particularly influential, while pedagogical training also plays a meaningful role.

From a practical standpoint, the study suggests that academic leaders should embed faculty development into institutional strategy, linking it with budget allocation, appraisal systems, and accreditation planning. Priority should be given to building robust research support mechanisms, providing constructive and regular feedback to faculty, and offering sustained opportunities for pedagogical enhancement rather than ad hoc workshops. When faculty development is systematic, evidence-based, and aligned with institutional goals, it strengthens teaching, research, and quality assurance outcomes.

The study is subject to certain limitations. It relies on self-reported data from faculty, which may be affected by perception bias. The cross-sectional design limits causal inference, and the sample is confined to six private universities in one state. Future research can extend this work through longitudinal designs, inclusion of objective performance indicators, and comparative analysis between private and public universities or between different states. Despite these limitations, the study provides robust empirical support for treating faculty development as a strategic organisational investment rather than a peripheral activity.

Acknowledgements

The authors sincerely thank the management and faculty members of the participating universities for their cooperation and valuable time. The institutional support provided by Ajinkya D Y Patil University and the International Foundation for Management and Organisational Research (IFMOR) is gratefully acknowledged.
